Originally built for older Burny controllers FastCAM® Kerf can usually be used on any controller that has difficulty computing kerf.

It either can't do the calculation or it is slow in the computation. For example, some versions of Anca and Burny.

Simply run your NC programs with FastCAM® Kerf software on your PC and watch them fly the moment they download to the controller! You begin cutting as soon as the program has loaded into memory of the control.

This simple program offers huge time savings on big nests with lots of arcs.

"FastCAM® Kerf™ saved me three hours in one cut! It saves big bucks on the downstroke and over years of use it's been one hell of a saving."
